temperature limitation (main goal): global temperature rise below 2°C

Four core pillars

- **Mitigation**
 - efforts to reduce global temperature rise below 1.5°C
 - countries submit individual national climate plans (aka Nationally Determined Contributions (NDCs)) every 5 years - idk if that is as effective
- **Adaptation - best bet imo**
 - improving countries' ability to adapt to adverse climate change impacts — possible area of focus
 - climate change + low-emission development w/o threatening food production
 - sumn to do w the use of AI to better predict wind patterns / further automation
<https://www.csiro.au/en/news/All/Articles/2026/May/Solar-Farms>
 - this way food production isn't compromised, as the efficiency of wind energy will be increased
 - maximising efficiency of hydropower plants - thru automated cleaning + other maintenance/ reporting problems
 - improving AUS's hydroelectricity potential
- **Finance**
 - financial mobilisation from developed nations → developing nations to lower emissions — process could be made more efficient
 - financially supporting a pathway to lower GHG emissions
- **Transparency and Accountability**
 - robust transparency framework for countries' report on their res — sumn to do w ensuring accurate

Update App

to be higher than the previous goal

- conducting a period global stocktake every 5 years → assess collective progress — sumn to make the data collection process easier and/or have unadulterated results (idk if that is a problem)

Wind energy

- converts kinetic energy of the wind into electrical energy
- correctly predicting the wind patterns allows wind turbine controllers to align the blade angles before the wind gust arrives → maximising energy capture → reducing reliance on crop based energy (e.g. sugarcane for ethanol production) but still lowering emissions

Hydroelectricity

- automated maintenance of tunnels and pipelines - (e.g. clearing debris, reporting hazards)
- if tunnels are well maintained → less disruptions → higher efficiency of hydroelectricity → reducing reliance on crop based energy yet lowering emissions → no compromise on agriculture.
