

all_ze_apps

This folder contains different versions of the UI with different features and was added to show the progress. Behold the breakdown, the files are ordered in terms of oldest to newest:

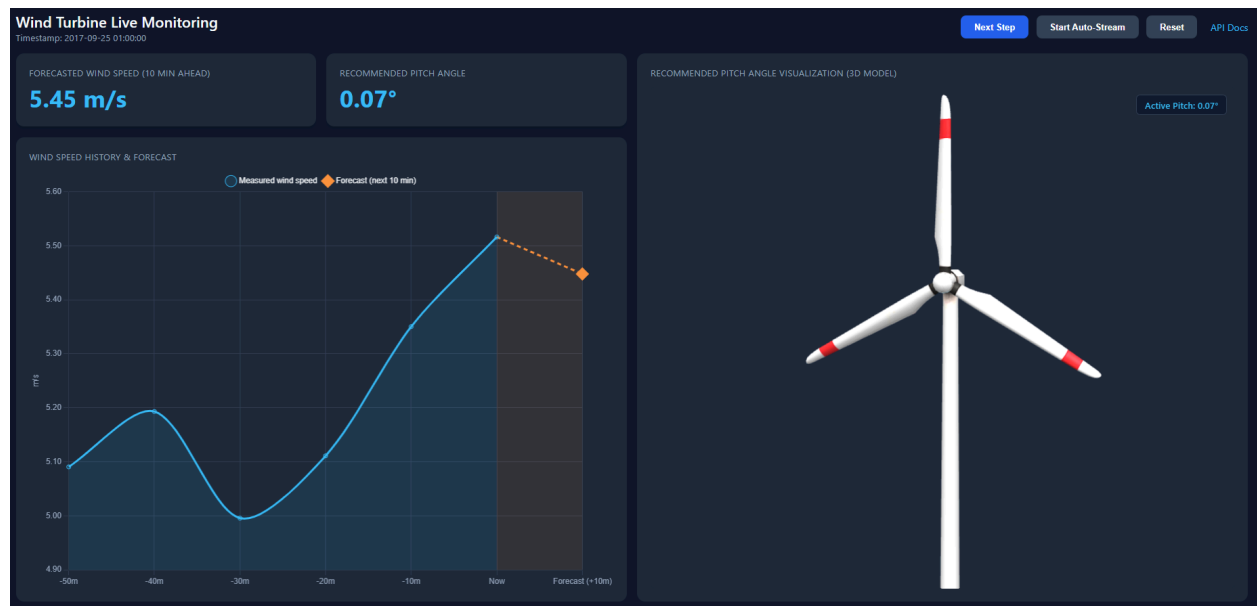

app_og: the baseline/initial design of the UI, Shows only forecasted wind & pitch angle cards, wind speed is shown graphically, 3d turbine model for visualisation, 3 simple buttons, 'next step', 'start auto-stream', 'reset'

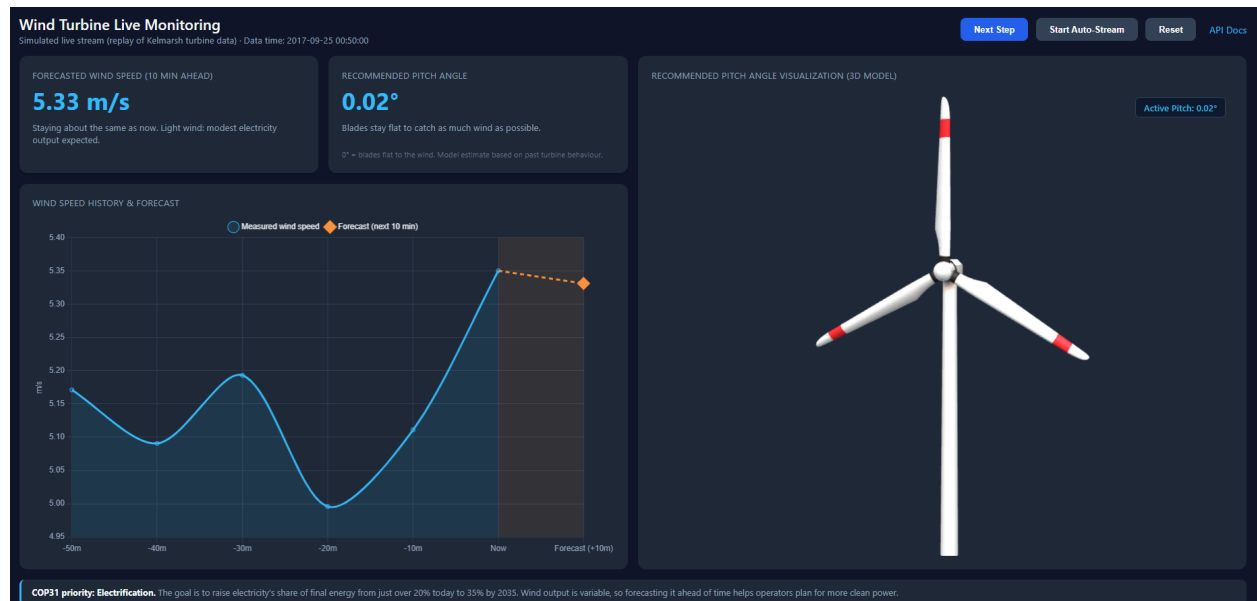

app_captions: captions were added beneath the forecasted wind & pitch angle cards for more clarity and for the user

app_with_caption: the last point in the graph which showed our forecast was highlighted orange and the point is changed to a diamond to show that the forecasted wind speed that is displayed in the card is also on the graph

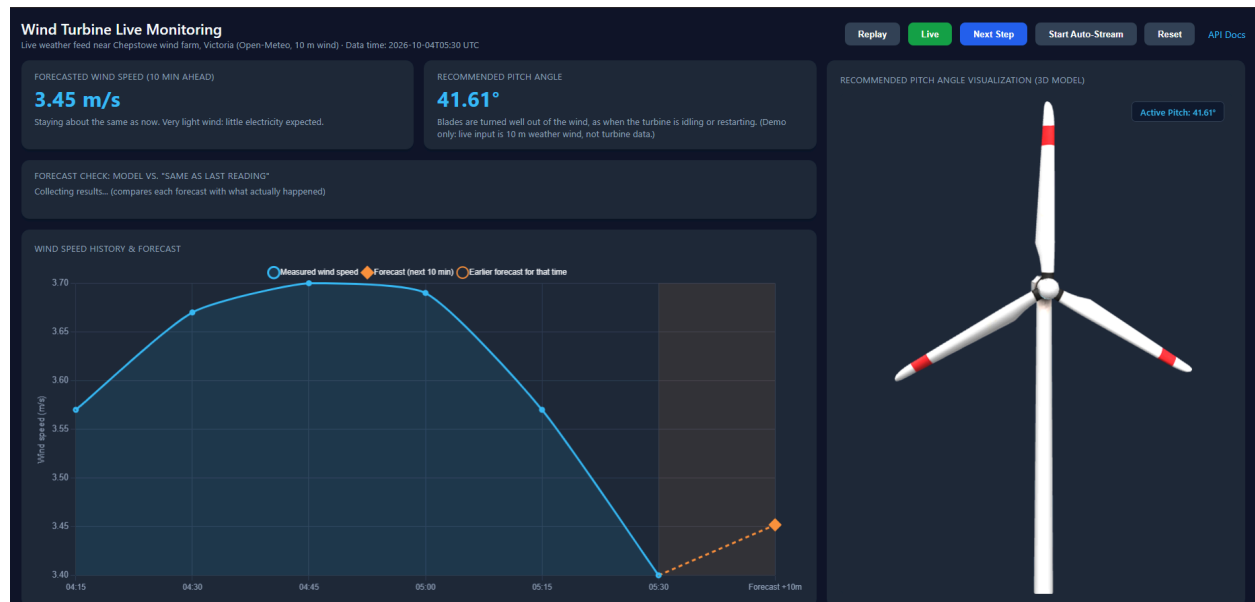

app_with_mostchanges_squashedgraph: the two previous files are combined, the captions under the card and COP31 priority is placed with the orange highlighted point in the graph

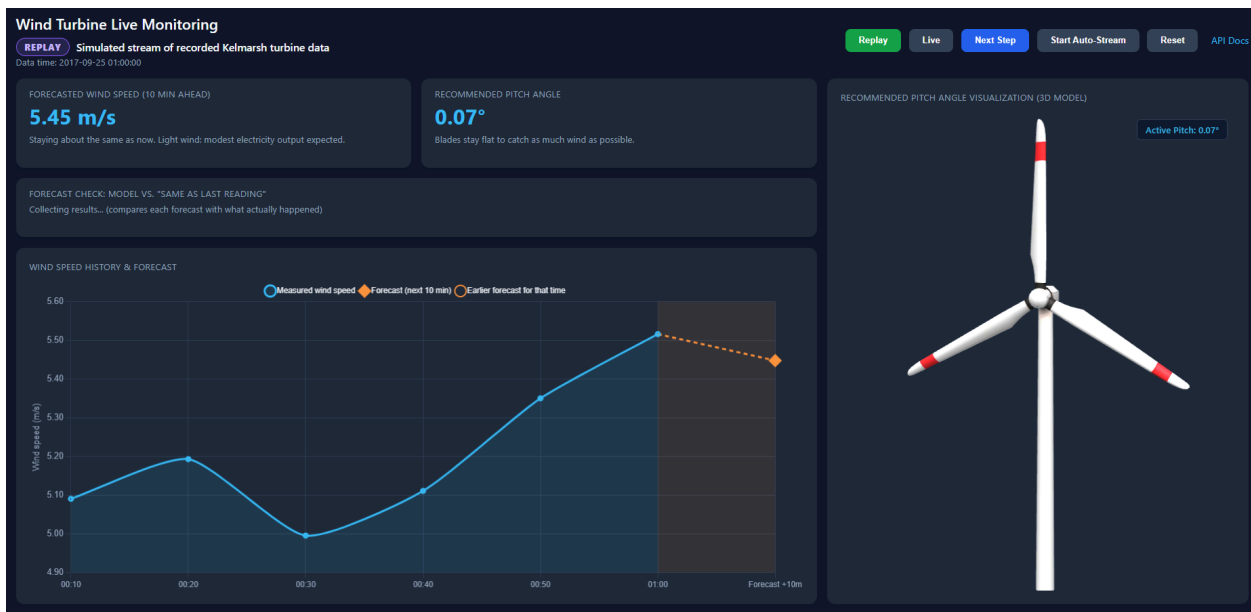

app_with_rolling_history: records the earlier forecast for that time and shows it as an orange dot, the average forecast error is also calculated and shown

app_with_live_toggle: at the top of the dashboard, 2 modes are now added as our team mate decided to add a live wind api, the replay mode is the same as before and the live mode shows the calculation made for the realtime wind

app_liveandreplayareclear_needtoscroll: under the heading of 'wind turbine live monitoring' it more clearly shows that the dashboard is in replay or live mode, the graph was also getting a bit squashed when playing auto-stream

app_spinningturbine: the 3d model of the turbine is now moving to have some interaction with the user, a pitch dial is added to show visually how much the pitch angle of the blade would move since it cannot be done to the 3d model

app_power_bigerror: we added a power card that would show the expected power, calculated by our turbine data, the average error was shown more visually comprehensive but

then we decided it was not required

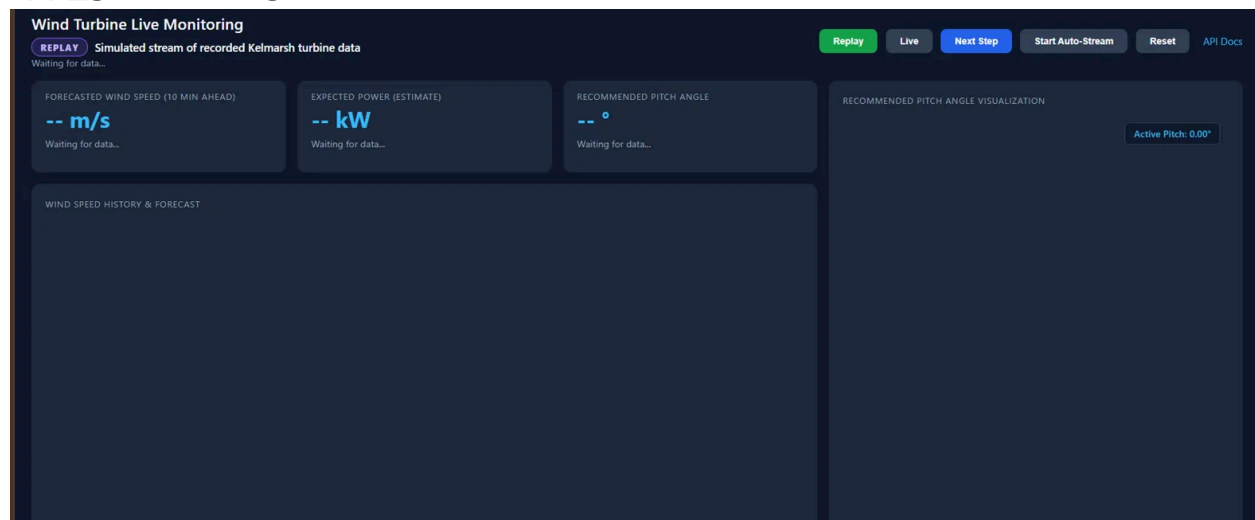

app_turbinedisappear:

when we first went onto the replay mode, the turbine was there but then disappeared when I went back to the replay mode, turns out the turbine panel wasn't removed, it was pushed off the right edge of the screen. In the Live mode, the chart stretches to full width. Back in Replay, the left column refused to shrink below that stretched chart width, so the turbine panel was shoved past the edge.

app_glitchwrongcode:

we made a coding mistake where the chart's legend started checking the current mode (Replay or Live). That check runs as soon as the chart is built, but the line that creates the mode variable sat further down the script. The page script crashed at that point, so the buttons, chart and turbine never loaded and your screenshot showed "Waiting for data...".

app_gapinlivedata: in the revised live mode, there was a gap shown in the graph, this was weird because it was teh live wind data and there should not have been gaps, it was found out that the app only picks up a new weather reading when it polls, every 5 minutes, and each reading stays current for about 15 minutes. If polling is interrupted for a quarter of an hour, a reading is lost for good and that is what happened, it was then fixed.
